

Our team wanted to investigate a biological phenomenon that has impacted the entire world as a whole, including the younger generation. Our studies led us to researching the biological mechanism behind SARS-CoV-2, the virus that causes Covid-19, which was responsible for the deaths of over 7.1 million people and one that disrupted young people's schooling and social lives. The rapid development of COVID-19 vaccines was another major turning point in the pandemic, making the first widespread use of mRNA vaccines with lipid nanoparticle delivery technology. Our articles and models demonstrate how exactly the mRNA vaccines work and the underlying biological mechanisms that make these vaccines effective.
